Adobe Inc. (NASDAQ: ADBE) — Equity Pitch

Recommendation: LONG Target price: $500 Price: $247.09 (close, Oct 19, 2026) Implied upside: +102%

Archit Chawla | Market cap $96.2B | EV $96.9B | Shares out 389.2M (Sep 18, 2026) | Street: Hold, avg target $272–284

Variant perception

The market prices Adobe as an AI loser whose creative franchise melts away: at $247 the stock is worth almost exactly my disruption scenario ($242), in which revenue growth fades to low-single digits and the FCF margin compresses toward 30%. The filings show the opposite trajectory — growth re-accelerating toward 13%, a ∼41% FCF margin, and a buyback retiring roughly 6% of the share count every year.

Business snapshot

Adobe is the incumbent in digital content creation and experience: Digital Media (Creative Cloud, Document Cloud/Acrobat) sells subscriptions to creators, knowledge workers and enterprises; Digital Experience sells the marketing/analytics stack to the same base. ∼90% gross margin, subscription-led, with $7.09B of current deferred revenue at Q3 FY2026 — revenue already contracted, not yet recognized. No dividend (verified in the filings); all capital return is buybacks; essentially no net debt ($0.72B).

Thesis

1. **Growth is re-accelerating, not rolling over.** Revenue grew +12.0%, +12.7% and +12.9% YoY in Q1–Q3 FY2026, up from +10.5% in FY2025; LTM revenue is $26.0B. Deferred revenue grew +11.1% YoY to $7.09B — the forward book compounds at double digits, which is not what a disrupted franchise looks like.
2. **The cash machine is intact.** LTM free cash flow is $10.59B, a 40.8% margin; FY2025 operating cash flow was $10.03B on capex of just 0.8% of revenue. AI investment runs through opex — it is already inside these numbers, not a capex wall still to come.
3. **The buyback is a second return engine.** $11.28B repurchased in FY2025 (114% of FCF); $35.7B over five years; shares outstanding down 13.9% since Jan 2024 (452.0M → 389.2M). In the model, diluted shares fall 427M → 344M by FY2028E, so GAAP EPS compounds $18.97 → $29.67 while net income grows a more modest 6–19% a year. (SBC of ∼$2.1B/yr is charged through the share-count roll — a real cost, not added back.)
4. **The multiple prices a funeral.** Today: 9.7× EV/LTM EBITDA and 9.1× price/LTM FCF. Adobe's own fiscal-year-end multiples, FY2021–FY2025 (EDGAR fundamentals, calendar year-end market caps): 15.7–40.6× EV/EBITDA and 15.2–39.1× P/FCF; medians 25.6× and 25.0×. Even FY2025's de-rated 15.2× P/FCF on FY2027E FCF/share gives $534.

Valuation

DCF on FY2027E–FY2031E FCF from a linked three-statement model (revenue $26.71B FY26E, $29.65B FY27E, $32.77B FY28E — an 11.3% FY25–28E CAGR with growth *faded*; FCF $11.24B / $12.91B / $14.37B). WACC 11.0%: risk-free 5.1%, beta 1.42 (Finnhub/MarketBeat, Oct 20, 2026), ERP 4.5% → cost of equity 11.5%; after-tax cost of debt 3.3%; terminal growth 3.0%.

Scenario	Assumptions	Value/share	vs $247.09
Bull	FCF +8%, WACC 10.5%, g 3.5%	$609	+147%
Base (target)	**Model FCF, WACC 11.0%, g 3.0%**	**$500**	**+102%**
Bear	FCF −18%, WACC 11.5%, g 2.5%	$369	+49%
AI disruption	Growth → LSD, FCF margin → ∼30%, WACC 11.5%, g 1.5%	$242	−2%

Cross-checks cluster with the DCF: 20.0× FY2027E GAAP EPS ($24.36) = $487; FY2025's own P/FCF on FY2027E FCF/share = $534. Sensitivity (WACC ±100bp, g 2.5–3.5%): $425–609. Consensus ($272–284) sits between my disruption and bear cases — it is paying for partial disruption. The Q4 FY2026 stub FCF (∼$3.8B, ≈$10/share) is excluded from the DCF, a deliberate conservatism.

Catalysts

Dec 9, 2026: Q4 FY2026 results + FY2027 guidance (Q4 guide: non-GAAP EPS $6.30–6.35; my model's FY26 non-GAAP EPS proxy is $24.64 vs the $24.45–24.50 guide). **Buyback pace** in that print (∼$2.6B assumed for Q4): at $247, every $1B retires ∼1% of the company. **AI monetization disclosures** (Firefly volumes, Acrobat AI attach) across FY2027 prints — the evidence the market says it is waiting for.

Risks — and what would change my call

- **AI-native competition** (Canva, Figma, generative image/video) taking Creative seats. A real risk — and already the price.
- **Seat-growth slowdown.** Tripwires: deferred revenue growth below +5% YoY for two consecutive quarters, or revenue growth below +9% — pillar 1 breaks; I would exit to the disruption valuation.
- **Guidance credibility.** A cut to FY2027 guidance on Dec 9 breaks the thesis's hinge.
- **SBC creep.** Stock comp is 8.2% of revenue (FY2025); toward 10%, the buyback runs harder just to stand still.
- **Volatility.** Beta is 1.42; size for a revisit of the $190 June 2026 low.

Methodology & verification

All historicals are SEC EDGAR company facts (CIK 0000796343), pulled Oct 20, 2026; periods keyed on end dates (EDGAR's `fy` field is the filing's year). Adobe's fiscal year ends the Friday nearest Nov 30 (FY2025 ended Nov 28, 2025). The Excel model (live formulas) was recalculated in LibreOffice and verified: FY2025 revenue ($23,769M), net income ($7,130M) and operating cash flow ($10,031M) tie exactly to EDGAR; the balance sheet balances (check = 0) in every forecast year; balance-sheet cash equals the cash-flow roll; the DCF target equals the sensitivity grid's center cell ($499.91). FY2026E = 9M actuals + a Q4 stub grown off derived Q4 FY2025, each rate an assumption cell with a rationale. The IS amortization line is derived as OperatingExpenses − R&D − S&M − G&A ($157M, FY2025) — the identically named EDGAR tag is a cash-flow concept that breaks the tie-out by ∼$150M.

Limitations

Beta is used as reported (1.42, itself inflated by the de-rating) — conservative for the target. Multiples history uses calendar year-end market caps (companiesmarketcap.com) vs late-November fiscal year-ends, and year-end snapshots rather than averages. FY2026E embeds one estimated quarter. The model is consolidated (EDGAR facts do not support a segment build). SBC is charged through dilution rather than as a cash cost in FCF — the standard treatment, stated openly.
